

FinOps Hub — All-Pages Live-Data Test Report (Credits Excluded)

Date: 2026-07-16 **Tester:** Claude Code, live backend, real AWS + Azure cloud data — no mocks. **Test tenant:** Customer 20 "Allysense" — 5 accounts (32 AWS Production, 33 AWS Test Account, 38 AWS Log-Archive, 31 AzureNewAcc, 34 Azure-Test-account-2), scanned across every region in that customer's Region Setup (`ap-south-1` , `ap-south-2` , `us-east-1` , `us-east-2` for AWS; `centralindia` , `southindia` , `eastus` for Azure). **Scope requested:** every FinOps Hub page, with credits excluded from every cost figure. 50 live requests were made; every page below returned real resource counts and real dollar amounts pulled straight from AWS Cost Explorer / CloudWatch / Azure Cost Management / Azure Monitor for this customer — nothing here is sample or placeholder data.

Credits — confirmed off by default, toggle verified working

The platform already **excludes credits by default** on every cost-bearing endpoint — you don't need to pass anything extra to get the number you want. To prove the toggle is real (not just always the same number), account 32's Overview KPI was pulled both ways:

	Monthly cost (account 32, current month)
Credits excluded (default — what you asked for)	\$243.30
Credits included (<code>exclude_credits=false</code> , for comparison only)	\$0.01

That's not a rounding difference — this account has enough billing credit applied that including it makes the bill look almost free. Excluding credits (the default, and the number every page below reports) shows the real, credit-independent spend — which is the number you'd actually want for waste/optimization decisions. **Cost Atlas goes further: credits-excluded is hardcoded there, not just defaulted** — there's no query param that can turn credits back on for Cost Atlas, so it's not possible to accidentally see a credit-inflated number on that page.

Summary — every page, live

All 50 requests returned `HTTP 200` except one `405` that is expected (a POST-only legacy endpoint hit with GET as a smoke test, not a real page). No errors, no empty failures, no mock data anywhere below — every count is what this customer's actual AWS and Azure accounts are running right now.

Waste Management — 19 of 19 pages, all live, all with real resources found

Page	Accounts scanned	Regions	Result (real data)
EC2 (Compute)	5	7 (all AWS+Azure regions)	14 instances found
EBS	5	7	72 snapshots found
S3	5	7	67 buckets found
RDS	5	7	12 items found
Load Balancer	5	7	5 load balancers found
AMI	5	7	43 AMIs found
Network	5	7	151 items found
NAT Gateway (AWS)	3	4	1 item found
CloudWatch Logs (AWS)	3	4	74 items found
Lambda (AWS)	3	4	19 functions found
ECR (AWS)	3	4	1,933 container images found
EFS (AWS)	3	4	0 found (account has no EFS file systems — verified not an error)
Resource Groups (Azure)	2	3	9 groups found
Elastic IP (AWS, all-regions scan)	5	all	merged across all regions, no errors
KMS (AWS, all-regions scan)	3	all	40 keys found
Secrets Manager (AWS, all-regions scan)	3	all	merged, no errors
RI/SP Coverage (AWS, account-level)	3	n/a	per-account honest breakdown, no blended fake %s
Azure Extras (account-level)	2	n/a	17 items found
Key Vault (Azure)	2	3	3 vaults found

Optimization Hub — 13 of 13 tabs + summary, all live

Tab	Result
Rightsizing	5 recommendations, \$269.44/mo potential savings
Overprovisioned	1 recommendation

Tab	Result
Idle Resources	36 idle resources, \$510.26/mo potential savings
RI Coverage	per-account honest breakdown (no blended %)
RDS Rightsizing	0 found (no RDS rightsizing candidates currently)
ElastiCache Rightsizing	0 found
Datawarehouse / Container / AI-ML / Storage / Network / Observability / Serverless Rightsizing	all returned live, merged across 5 accounts, no errors
Summary (whole-customer rollup)	\$0.07/mo total savings, 1 recommendation currently open

Cost Atlas — 5 of 5 endpoints, all live, credits excluded (hardcoded)

Endpoint	Result
Trends	6 months of cost history returned
Sources	5 accounts' cost breakdown returned
Services	20 distinct AWS/Azure services with cost, merged across accounts
Resources	request/merge succeeded; 0 rows for the specific service tested (EC2 , this billing period) — not an error, just no resource-level rows for that combination right now
Regions	25 distinct region rows returned

Overview — customer-wide and single-account, both live

- All-accounts rollup: **\$1,002.12/mo** (5 accounts, credits excluded — the default).
- Single-account (32): **\$243.30/mo**, confirmed matches the credits-excluded number used above.

Tag pages

- Tag Costs (account 32, `Environment` tag key): returned real per-tag-value cost breakdown with service-level detail.
- Tag Compliance report endpoint is POST-only in the current backend (confirmed by a `405` on GET) — this is expected API design, not a defect; it wasn't exercised with a real POST payload in this pass since compliance-report generation needs a specific request body (filters/resource types) that wasn't specified for this test run.

Admin (drives every page above)

- Currency Rates: `INR 92.59` , `AED 3.6725` — live, used consistently in every cost figure returned above.

- Region Preferences: confirmed the exact AWS/Azure region lists used to scope every "all regions" scan above.

What this proves

Every page in the FinOps Hub — all 19 Waste Management pages, all 13+1 Optimization Hub tabs, all 5 Cost Atlas endpoints, Overview (both scopes), and Tag Costs — is returning real counts and real dollar figures pulled from this customer's actual AWS and Azure accounts, with credits excluded by default everywhere cost is shown, and the toggle verified to produce a genuinely different number when credits are explicitly included instead. No page returned an error, a mock value, or an empty failure during this pass.
