The Challenge

Most cloud cost platforms fetch data from Azure REST APIs on every dashboard load. With 20+ subscriptions and 12 months of history, that means **7,000+ sequential API calls** — taking 30 to 180 minutes to load a single report. Data is stale, rate limits cause failures, and historical comparisons require expensive custom infrastructure. The more your cloud grows, the worse the problem gets.

How Codly Solves It

Codly connects Azure Cost Management exports directly to **Azure Synapse Analytics**. Your full billing history is stored and indexed in Synapse — so every cost question your team asks is answered from Synapse in seconds, with no API calls at query time. The analytics layer costs **\$0.01 per month today** and stays under **\$3.00/month at 100 VMs** — because Synapse charges only for data scanned, not for always-on compute.

Instant History	Near-Zero Cost	No Rate Limits
- Any time range available in <8 sec - No incremental API calls - Full 12+ month trend always on	\$5 per TB scanned (serverless) \$0.01/month today \$0.34/month at 100 VMs	- Unlimited concurrent queries - Works with 100+ subscriptions - No throttling under load

Your Real Data — Queried Live from Synapse

Both charts below were generated in under 4 seconds from a single query to your Synapse workspace (`costexplorersynapse`, table: `cost_usage`). This is what your dashboard serves every time it loads.

Three Ways to View Your Costs — New in Codly v4

Codly v4 introduces three simultaneous cost views, each designed for a different audience. All three come from the same Synapse data store.

View	Who Uses It	What It Shows	Key Question Answered
Amortized	CFO / Finance	RI costs spread evenly across the commitment period — no purchase-month spike	What is our true ongoing cloud commitment?

View	Who Uses It	What It Shows	Key Question Answered
Focus (Default)	FinOps / Budget owners	Microsoft-recommended standard view for day-to-day reporting and reconciliation	What is our standard spend vs budget?
Actual	Accounting / Audit	Raw charges exactly as they appear on the invoice, including full RI purchase amounts	What was charged to us this month, exactly?

What Your Team Can Do

Time to Answer Common FinOps Questions

Key questions now answered in seconds: 12-month cost history, team-level spend by tag, Reserved Instance savings vs actual charges, budget vs actual variance, cost forecasting, and automated weekly PDF reports — all without any API calls at query time.

Analytics Cost as You Scale to 100 VMs

Component	Today (4 VMs)	At 100 VMs	Change
Synapse analytics (platform cost)	\$0.01/month	\$0.34/month	+\$0.33
VM Compute (D2v3–D4v3)	\$54/month	~\$9,000/month	+\$8,946
Fixed services (AI, SaaS, network)	\$419/month	\$419/month	No change
Total Azure Bill	~\$478/month	~\$9,530/month	~20x

The Synapse analytics layer grows by 33 cents as VM count grows 25x. Your total Azure bill grows ~20x — but that is infrastructure cost, not platform cost.

Full Capability Summary

Capability	Traditional API	Codly on Synapse
12+ months cost history	Manual effort	Always available, instant
Spend by team / environment (tags)	Basic	Full — any tag dimension
RI savings vs actual comparison	Not possible	Amortized vs Actual view
Budget vs actual — real time	Slow / manual	Real-time from Synapse
Cost anomaly detection	Not available	Automated, AI-powered
AI chatbot for cost questions	Not available	Natural language, instant
Automated weekly cost reports	Not available	Generated from Synapse
Works with 100+ subscriptions	Degrades badly	Consistent performance
Monthly analytics platform cost	\$18–\$130	\$0.01–\$0.34

Codly's FinOps platform gives Finance, FinOps, Engineering, and Accounting teams accurate cost data in seconds — for a platform cost of under \$4 per year at 100 VMs. Each role gets the right view. Questions

that used to take hours now take seconds.
